DETAILED ACTION

Allowable Subject Matter

Claims 1-16 are allowed.

The following is an examiner's statement of reasons for allowance: the prior art either taken singularly or in combination fails to disclose a thermal interface layer between a heat sink and an exothermic device, wherein the composite of the layer comprises of carbon nanotubes dispersed in a matrix of ceramic; the composite have been uniaxially compressed in a direction transverse to the heat sink surface to provide the composite with a thermal diffusivity in the transverse direction that is lower than the thermal diffusivity in the transverse direction of a matrix of ceramic material lacking carbon nanotubes. Applicant's argument regarding the resulted structure of the composite by uniaxially compression to provide the claimed property is persuasive. (Applicant's Remark 9/20/2004, pages 3-4) Reference to Chang is the closest prior art, which show the claimed carbon nanotubes and a ceramic material but fails to show the uniaxial compression, which yield the claimed property. Reference to Houle is the second closest prior art but fail to disclose carbon nanotubes. Houle's carbon fibers are twisted in a bundle form and arranged in layers and are not uniaxially compressed to have the claimed property.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

Art Unit: 3743

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Houle et al. (US 2002/0038704A1) discloses carbon-carbon fiber composite heat spreader.
